Cosmetic Membrane

PVA Nanofiber Membrane

Product Description

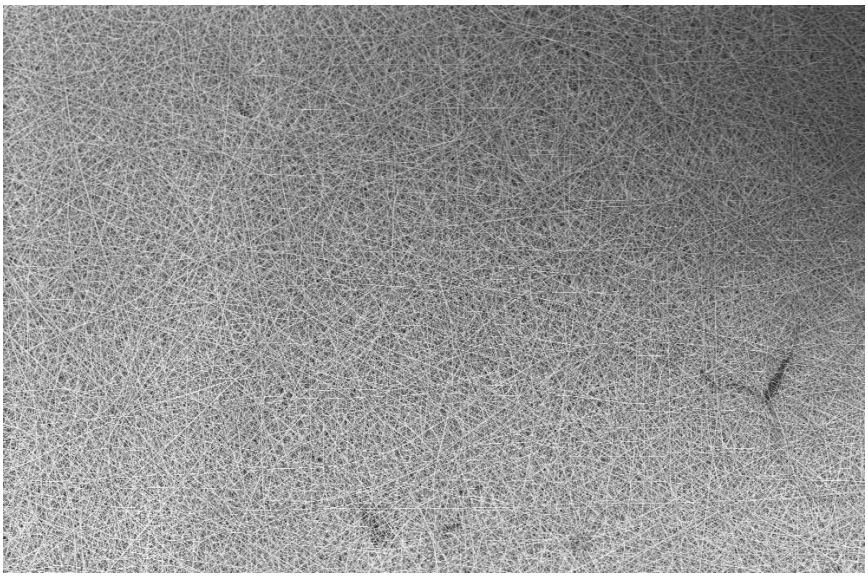
E-Spin Nanotech manufactures advanced electrospun PVA nanofiber cosmetic membranes specifically designed for skincare and cosmetic delivery applications. Polyvinyl alcohol (PVA) is a water-soluble synthetic polymer known for its excellent film-forming capability, high hydrophilicity, softness, and biocompatibility, making it ideal for direct skin contact.

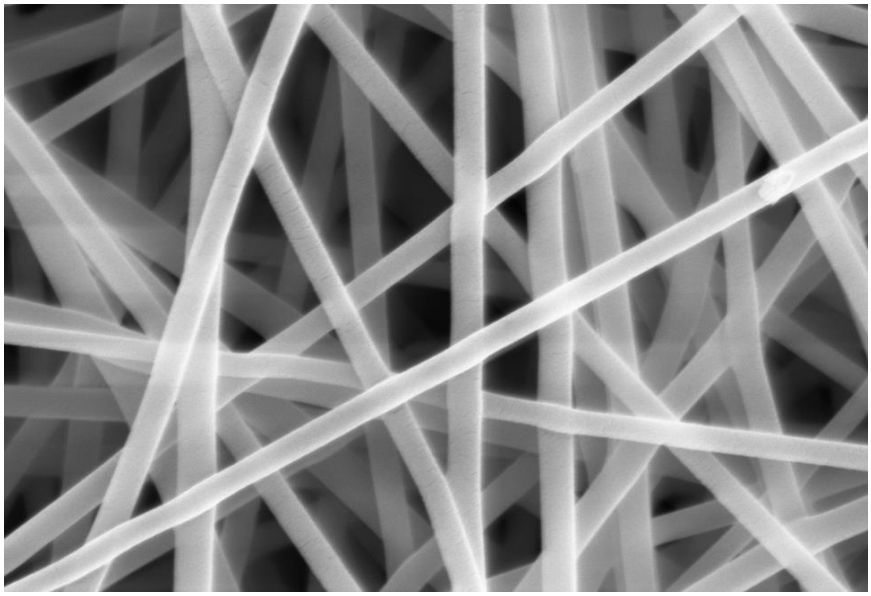
Electrospun PVA nanofiber membranes possess ultra-fine fibre diameter, high porosity, and interconnected pore structures, which enable efficient absorption and controlled release of cosmetic ingredients such as serums, vitamins, moisturizers, and active compounds. The nanofibrous structure provides a large surface area, allowing enhanced interaction with the skin and improved penetration of active ingredients.

Due to their soft, breathable, and skin-friendly properties, PVA nanofiber membranes are highly suitable for facial masks, beauty patches, and advanced skincare delivery systems. The material can also be modified or blended with natural polymers, bioactive compounds, or cosmetic additives to improve hydration, stability, and functionality for specific skincare formulations.

Key Applications

- Facial sheet masks and nano-fibre masks
- Under-eye patches and beauty patches
- Controlled release skincare delivery systems
- Hydrating and moisturizing cosmetic membranes
- Carrier layers for serums, vitamins, and cosmetic actives





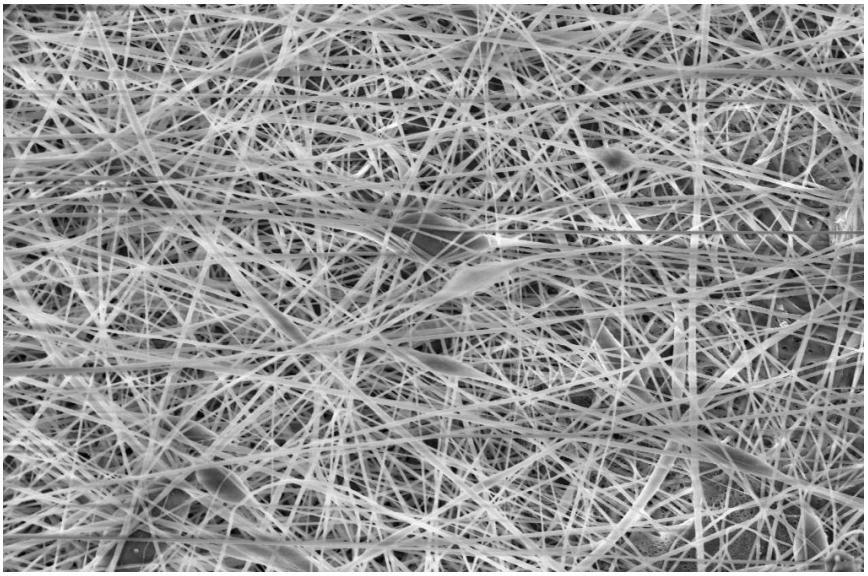
Cellulose Nanofiber Membrane

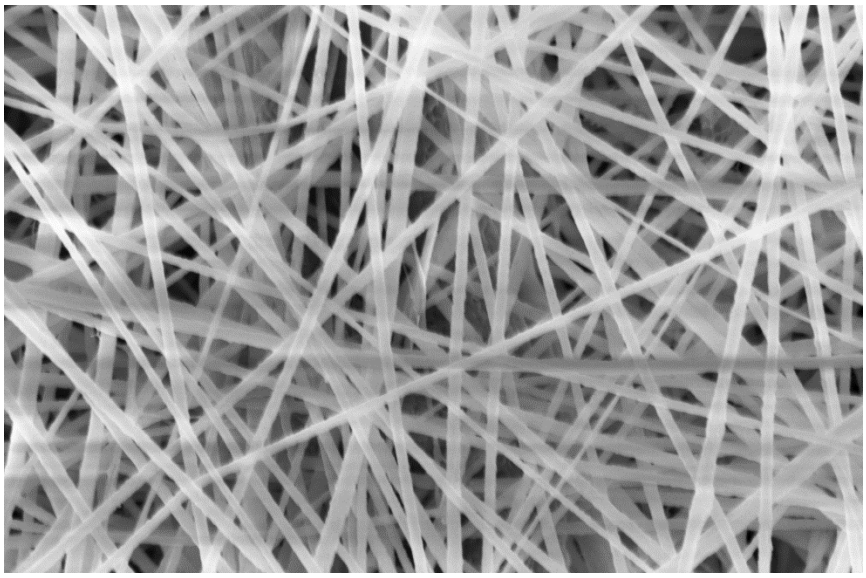
Product Description

E-Spin Nanotech manufactures advanced electrospun cellulose nanofiber cosmetic membranes designed for modern skincare and cosmetic delivery applications. Cellulose is a naturally derived biopolymer known for its excellent biocompatibility, biodegradability, skin-friendly nature, and high moisture retention capability, making it highly suitable for cosmetic and personal care products.

Electrospun cellulose nanofiber membranes exhibit ultrafine fiber diameter, high porosity, and an interconnected pore structure, which enable efficient absorption and controlled release of cosmetic actives such as serums, vitamins, antioxidants, and moisturizing agents. The nanofibrous network provides a large surface area, allowing enhanced interaction with the skin and improved penetration of active ingredients.

Due to their soft texture, breathability, and natural origin, cellulose nanofiber membranes are ideal for facial sheet masks, beauty patches, and advanced cosmetic delivery systems. Additionally, cellulose nanofibers can be functionalized or blended with bioactive compounds and cosmetic additives to improve hydration, stability, and performance for specialized skincare formulations.

Key Cosmetic Applications




• Facial sheet masks and nanofiber masks
• Under-eye patches and beauty patches
• Controlled release cosmetic delivery systems
• Hydrating and moisturizing skincare membranes
• Carrier layers for serums, antioxidants, and cosmetic actives
